# Performance Monitoring Always On Availability Groups

Anthony E. Nocentino aen@centinosystems.com

## Anthony E. Nocentino

- Consultant and Trainer
- Founder and President of Centino Systems
  - Specialize in system architecture and performance
  - · Computer Science M.S., B.S.
  - Microsoft MVP Data Platform 2017
  - Friend of Redgate 2015-2017
- email: aen@centinosystems.com
- · Twitter: @nocentino
- Blog: www.centinosystems.com/blog
- Pluralsight Author: www.pluralsight.com

## Overview

- Motivation
- How Availability Groups move data
- Impact of replication latency on availability
- Monitoring techniques
- Demo
- Dealing with replication latency

## Why is this important?

- Recovery Objectives
  - Recovery Point Objective RPO
  - Recovery Time Objective RTO
- Availability
  - How much data can we lose?
  - How fast will the system fail over?
- Monitoring and Trending
  - Establish a baseline for analysis are we meeting those objectives?
  - Impact on resources
- Ownership
  - All of the components are monitored by the DBA

## Data Movement In Availability Groups

- Transaction log blocks are replicated to secondaries
- Replication mode
  - Synchronous
  - Asynchronous
- Database mirroring endpoint

## Network Based Replication

- Strong working relationship with network team
  - Maintenance patching, network outages, database
- Network conditions can impact your AG's availability
  - Latency how long it takes for a packet of data to traverse the network from source to destination.
  - Bandwidth how much data can be moved in a time interval

## Network Latency

- Often measured in milliseconds, sometimes microseconds
- Directly impacts network throughput
  - TCP Congestion Window
- ping isn't your best measure of latency, by default it doesn't include any load...measure your workload
- It's often up to us to PROVE to the network team there is an issue
  - · Pinging 192.168.2.1 with 32 bytes of data:
  - Reply from 192.168.2.1: bytes=32 time=1001ms TTL=128
- In synchronous mode, you have to wait for network latency

## Availability Group Flow Control

- Used in response to network and system conditions
- Log blocks exchange sequence numbers
- The AG will enter flow control mode IF:
  - The primary detects too many unacknowledged messages, the primary stops sending messages
  - The secondary needs to tell the primary to back off, likely due to resource constraints, it will send a flow control message to the primary to back off
- Primary polls every 1000ms for a change in flow control state
  - Secondary will message primary to leave flow control mode

From: SQL Server PFE Blog - http://bit.ly/1ZpGyIL

## Database Synchronization States

- Not synchronizing
- Synchronized
- Synchronizing
- Reverting
- Initializing

https://msdn.microsoft.com/en-us/library/ff877972.aspx

## Failover Modes

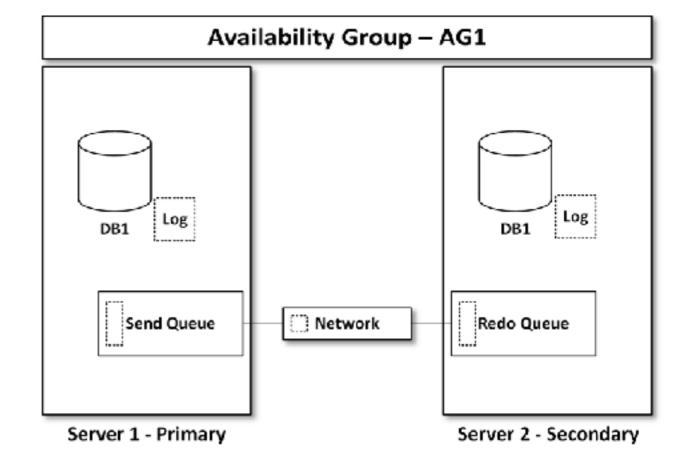

- Automatic
  - Synchronous mode only
  - Synchronization state must by synchronized
  - Commonly used within a data center
- Manual
  - Synchronous or Asynchronous
  - Commonly used between data centers

https://msdn.microsoft.com/en-us/library/hh213151.aspx

## Send Queue

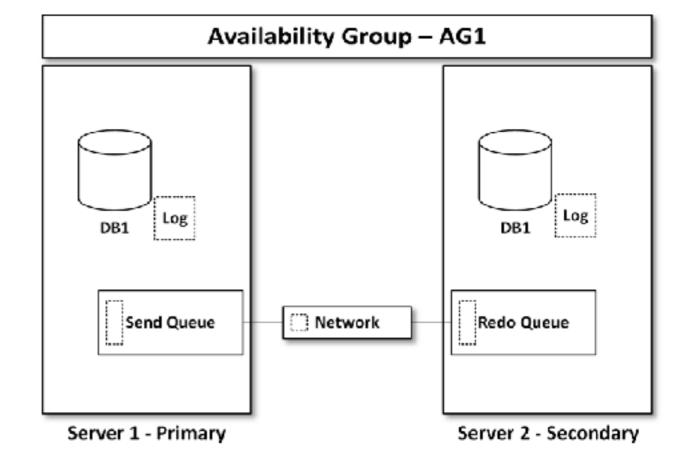

- Queues log blocks to be sent to the secondaries
- Each replica maintains it's own view of the send queue
- Queued data is as risk to data loss in the event of a primary failure
- The send queue can grow due to an unreachable secondary, network outage, network latency and large amount of data change

## Redo Queue

- Queues log blocks received on the secondary
- Each replica has it's own redo queue
- On failover, the redo queue must be completely processed
- The redo queue can grow due to a slow disk subsystem or resource contention or sustained outage and subsequent reconnection of a secondary

## Send Queue Impact on Availability

- When log generation on primary exceeds the rate they can be sent to the secondaries...
  - No automatic failover
  - Data loss
  - Stale data for reporting from secondaries
  - Stale data for off-loaded backups on secondaries
  - Off-loaded log backups can fail
  - Transaction delay
  - Fill up transaction logs
- Even in synchronous mode!

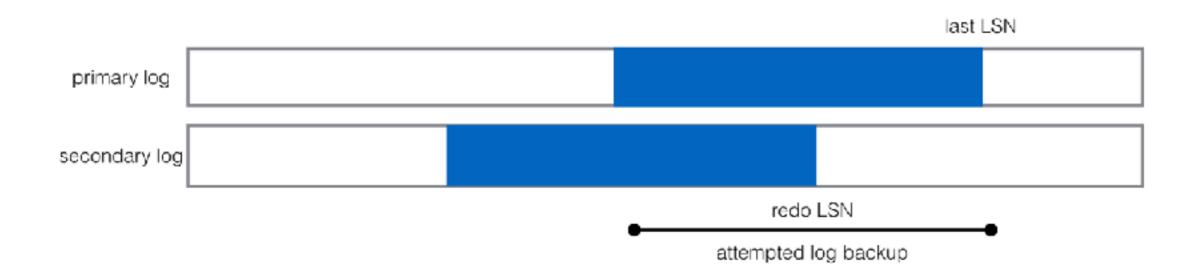

## Redo Queue Impact on Availability

- When log blocks received on the secondary exceed the rate they can be processed by the redo thread...
  - Delayed failover
    - Detect failure
    - Process Redo Queue
    - Crash recover database
  - Stale data for reporting from secondaries
  - Stale data for off-loaded backups on secondaries
  - Off-loaded log backups can fail
  - Transaction delay

## Log Backups

## Transaction Delay

- In synchronous mode, when secondaries are behind, queries on the primary can be delayed
- HADR\_SYNC\_COMMIT
- HADR\_SYNCHRONIZING\_THROTTLE replica back online

## Disconnected Replica

- When a synchronous secondary exceeds it's session time-out, it changes to asynchronous commit mode
- When the secondary comes back online, it will attempt to re-sync, and resume synchronous mode
- HADR\_SYNCHRONIZING\_THROTTLE time to go from SYNCHRONIZING to SYNCHRONIZED
- WRITELOG while replica is down

# Maintenance Events That Can Impact Availability

- Bulk data modifications
- Database maintenance
- Network or server maintenance

- Carefully plan maintenance
- Collaborate with other teams!

## Monitoring AG Performance

- Dynamic Management Views
  - sys.dm\_hadr\_database\_replica\_states
- Perfmon Counters
  - SQL Server: Availability Replica
    - Replication data messages sent, bytes sent, flow control
  - SQL Server:Database Replica
    - Database data log bytes sent, queue sizes, transaction delay per database

## Measuring Replication Latency

- sys.dm\_hadr\_database\_replica\_states
  - · log send queue size
  - log\_send\_rate
  - redo\_queue\_size
  - redo\_queue\_rate
- On the primary there's a row for each database on each replica
- On the secondaries there's a row for each database on that replica
- Replicas track their own values
- When a replica goes offline...
  - log\_send\_queue\_size changes to NULL

log send queue is from primary to secondary

## Measuring Replication Latency - ugh!!!

- Well, it looks like sys.dm\_hadr\_database\_replica\_states doesn't report the correct values for log\_send\_rate and redo\_queue\_rate
  - Last know sent average throughput???? what is that?
  - Reported on Connect
    - https://connect.microsoft.com/SQLServer/Feedback/Details/928582
  - Known bug in SQL Server 2012 or 2014
    - https://support.microsoft.com/en-us/kb/3012182
    - Cumulative Update 5 or better
  - Observed in SQL 2016 and 2017
  - Perfmon!

## Measuring Latency with Perfmon

#### Primary

- SQLServer:Databases Log Bytes Flushed/sec
- SQLServer: Availability Replica Bytes Sent to Replica/sec (compressed)
- Network Interface Bytes Sent/sec

#### Secondaries

- SQLServer: Availability Replica Bytes Received From Replica/sec (compressed)
- SQLServer:Database Replica Log Bytes Received/sec (log send rate/uncompressed)
- SQLServer:Database Replica Redone Bytes/sec (log redo rate)
- Network Interface Bytes Received/sec

## Wait stats - sync vs. async

## Synchronous - HADR\_SYNC\_COMMIT

```
sqldk.dll!XeSosPkg::wait_info::Publish+0x138
sqldk.dll!SOS_Scheduler::UpdateWaitTimeStats+0x2bc
sqldk.dll!SOS_Task::PostWait+0x9e
sqlmin.dll!EventInternal<SuspendQueueSLock>::Wait+0x1fb
sqlmin.dll!SequencedObject<LogBlockId,SequencedWaitInfo<LogBlockId>0>::WaitUntilSequenceAdvances+0x160
sqlmin.dll!HaDrCommitMgr::HardenNotifyInternal+0x1af
sqlmin.dll!HaDrCommitMgr::HardenNotify+0xac
sqlmin.dll!RecoveryUnit::NotifyHardenParticipants+0x1e2
sqlmin.dll!RecoveryUnit::HardenLog+0x217
sqlmin.dll!XdesRMFull::CommitInternal+0x6b8
sqlmin.dll!XactRM::SinglePhaseCommit+0x1a1
sqlmin.dll!XactRM::CommitInternal+0x472
```

## Asynchronous - WRITELOG

```
sqldk.dll!XeSosPkg::wait_info::Publish+0x138
sqldk.dll!SOS_Scheduler::UpdateWaitTimeStats+0x2bc
sqldk.dll!SOS_Task::PostWait+0x9e
sqlmin.dll!SQLServerLogMgr::WaitLCFlush+0x219
sqlmin.dll!SQLServerLogMgr::LogFlush+0x29e
sqlmin.dll!SQLServerLogMgr::WaitLogWritten+0x17
sqlmin.dll!RecoveryUnit::HardenLog+0x25e
sqlmin.dll!XdesRMFull::CommitInternal+0x6b8
sqlmin.dll!XactRM::SinglePhaseCommit+0x1a1
sqlmin.dll!XactRM::CommitInternal+0x472
...
```

## Measuring Latency with Extended Events

#### In SQL 2014 - SP2/2016 - SP1

Each event has a measure duration

#### **Primary**

hadr\_log\_block\_group\_commit

log\_block\_pushed\_to\_logpool

log\_flush\_start

hadr\_log\_block\_compression

hadr\_capture\_log\_block

ucs\_connection\_send\_msg

hadr\_log\_block\_send\_complete

log flush complete

#### Synchronous Secondary

hadr\_transport\_receive\_log\_block\_message

hadr\_log\_block\_decompression

hadr\_apply\_log\_block

log\_block\_pushed\_to\_logpool

log\_flush\_start

log\_flush\_complete

hadr\_send\_harden\_lsn\_message

ucs\_connection\_send\_msg

hadr\_lsn\_send\_complete

hadr\_receive\_harden\_lsn\_message hadr\_db\_commit\_mgr\_harden

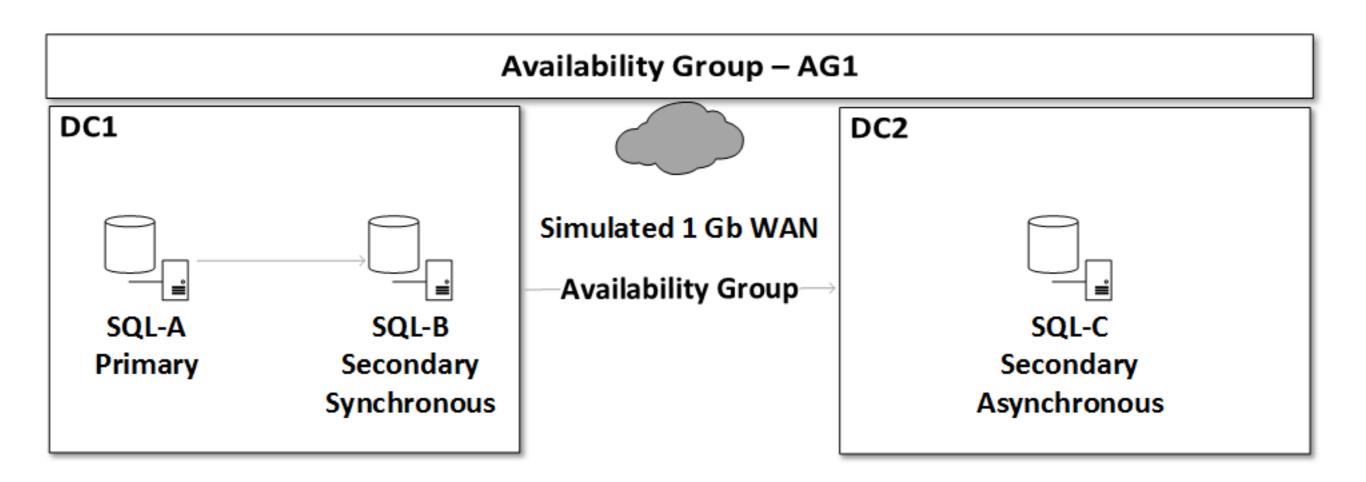

## Monitoring Tools

- Build your own
- AlwaysOn Dashboard
- Third Party Tool
  - SentryOne SQL Sentry for SQL Server
  - Redgate SQL Monitor

## Demo

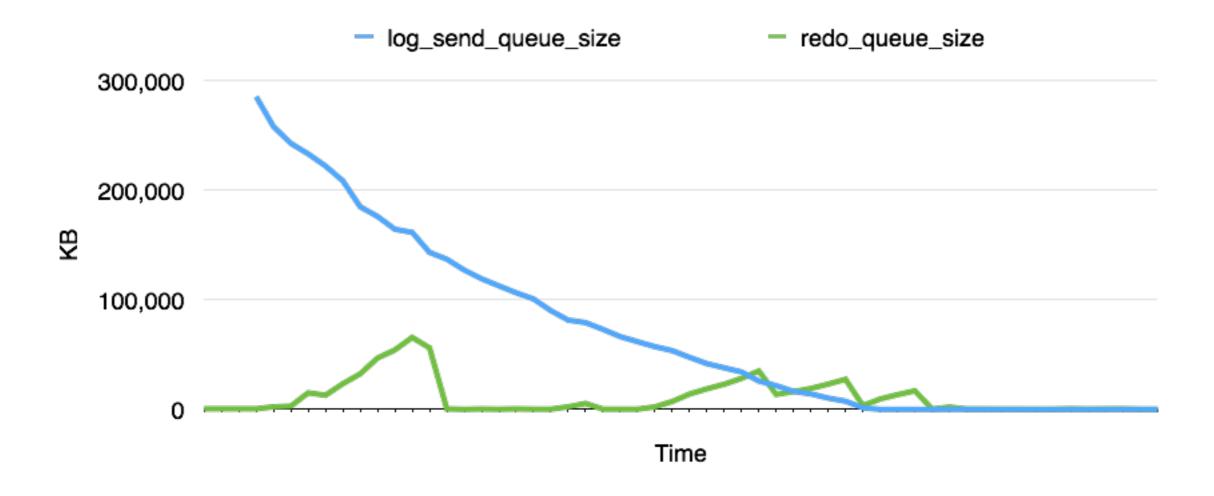

# Demo

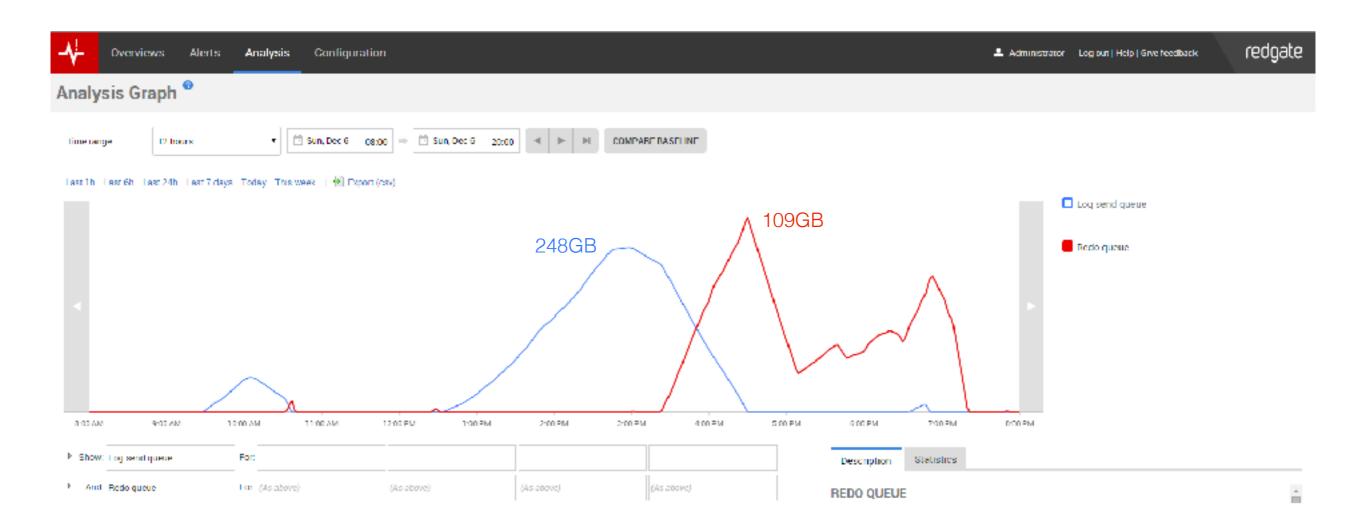

## Demo

## Real World Example

## Dealing With Slow Replication Latency

- Identify your bottleneck and mitigate it
  - Minimize log generation
    - Use smart index maintenance/Better Indexes
  - More bandwidth
    - Perhaps a dedicated network connection
  - Better hardware
    - Log throughput on secondaries needs to be equal to primary
  - Upgrade SQL Server
    - 2012/2014 single threaded redo ~45MB/sec
    - 2016 multi-threaded redo ~600MB/sec

## Key Takeaways

- It is imperative to track and trend replication latency in your Availability Groups so you can answer the questions
  - How much data can will I lose?
  - How long it will take to failover?
- Monitor and trend send\_queue and redo\_queue in sys.dm\_hadr\_database\_replica\_states on replicas to measure availability impact
- Understand how much log is generated in your databases
- Understand your system's operations, consider downtime for patching and network maintenance

## Key Takeaways

- Plan database maintenance
- Use a smart index maintenance strategy!
- Offloaded backups
  - If availability is most important, backup on primary
